Projet

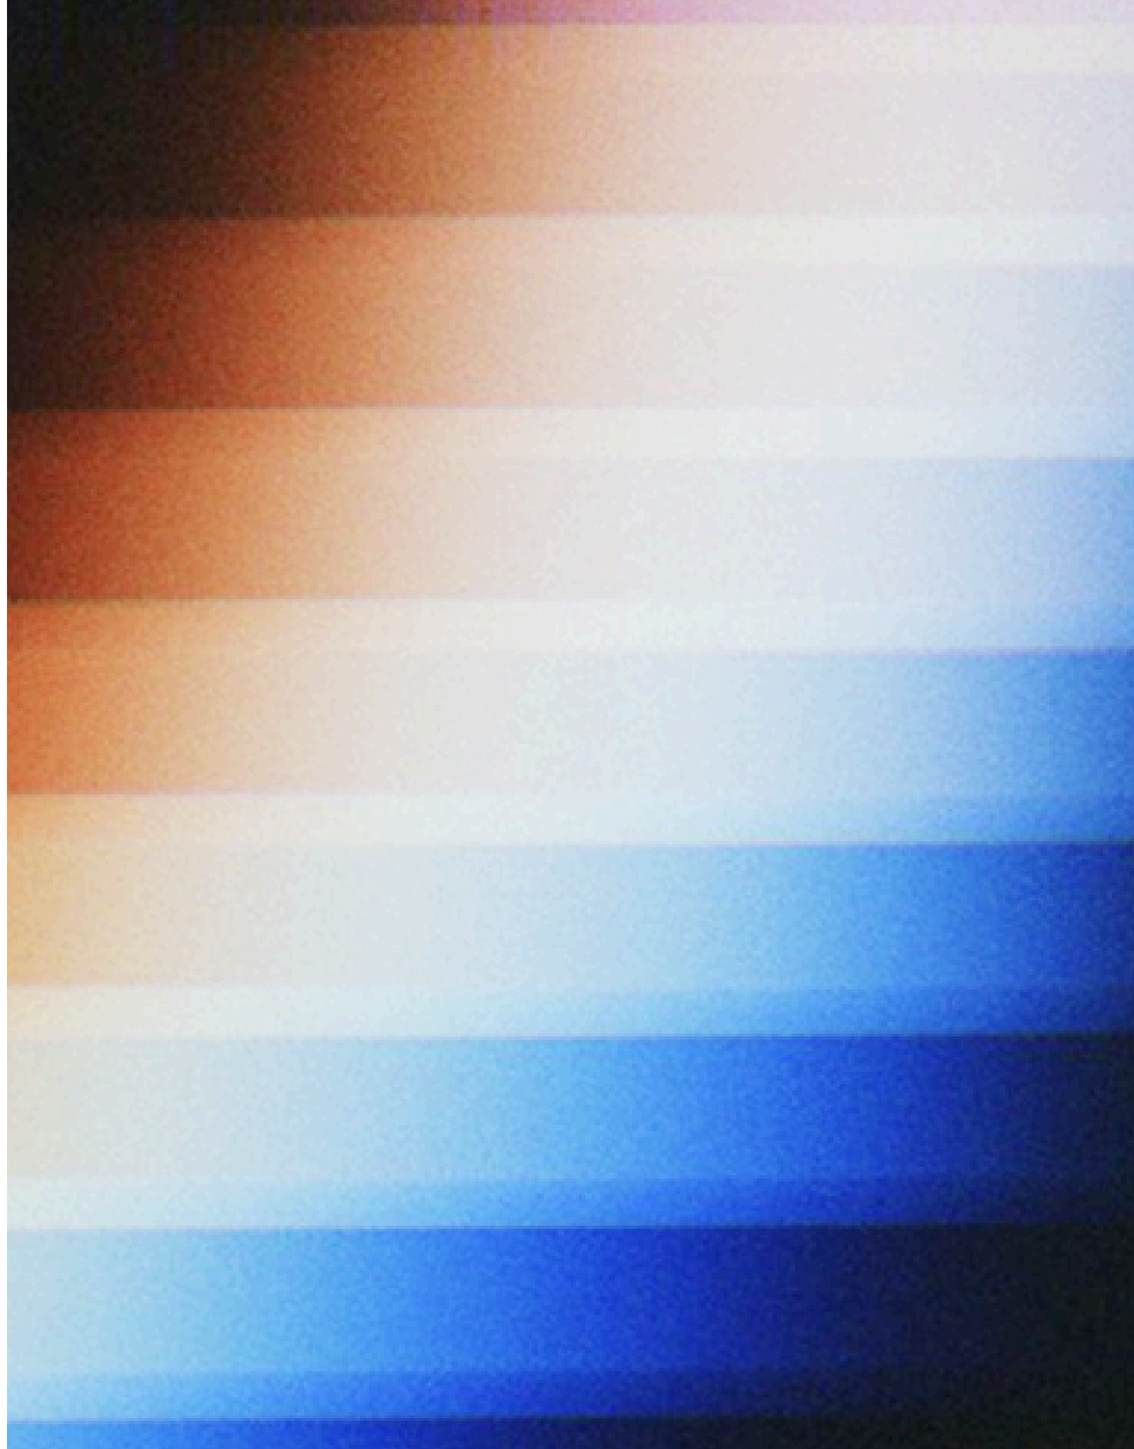

SINGAPORE · 10 OCT 2026

Hack & Hire

Proof of work.

Sustainability Edition kickoff.
Co-organised with NUS CAT.

myprojet.co Acacia College NUS

The job market has changed

Today's job market is more competitive than ever.

TODAY

Job requirements are higher

Internships are more competitive than ever, and credentials alone don’t cover the job scopes and requirements of the AI era.

WHAT MATTERS

Proof of work

We run proof-of-work case competitions where you use AI tools to solve real problems, build meaningful projects to add to your portfolio.

What you build and deliver outweighs your pedigree.

Build your proof-of-work

Projet connects students with employers through real company projects.

Work

On real company problems

Using AI effectively.

Build

meaningful projects for your portfolio

Earn

Verified testimonials

From companies.

Open

Doors to internships and full-time opportunities

Build something worth hiring you for..

One weekend pilot.

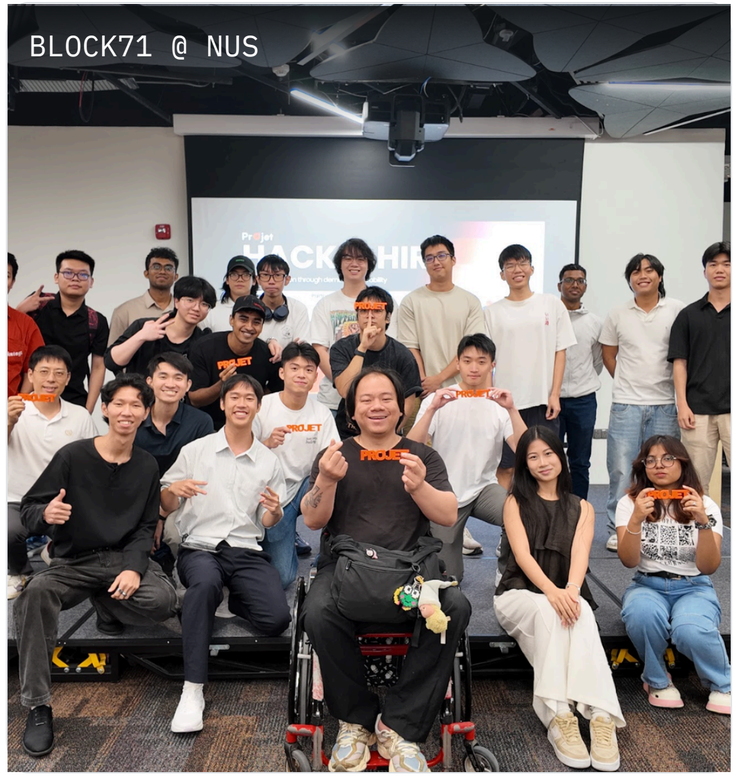

Three companies posted a brief from their own problems. Candidates built on *myprojet.co*, scored on the rubric, and pitched directly to the founders.

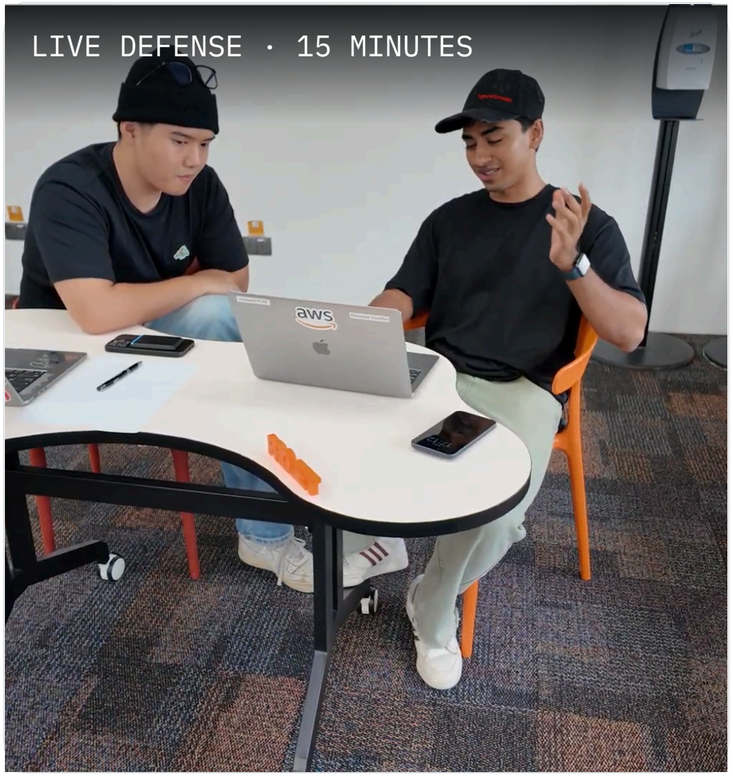

WHAT PARTICIPANTS SAID

“I liked the unique 1-on-1 pitch with the founders, showing them what I built and my thought process.”

“Less like a competition and more like a real startup discussion.”

LINKEDIN

Startup Shuffle x Projet

We hosted 15 live challenges from real startups, all on-site.

THE CHALLENGES

15 live challenges
From real startups.

All on-site
Every challenge was on-site.

myprojet.co/challenges

SIX AREAS

01
AI & Data
Medical / Clinical Intern

02
Business & Strategy
Business & Partnerships, GTM, Market Entry

03
Consumer & Research
Growth Experimentation & Customer Analytics

04
Engineering & Tech
Product Engineer, Mobile, Product Development

05
Marketing & Media
GTM, Video, Growth, Brand, Sales

06
Product & Design
Product Design (UI/UX) Intern

Hack & Hire: Sustainability Edition

Six real problem statements from four sustainability companies.
Co-organised with NUS Climate Analytics and Technology Club (NUS CAT).

THE WEEK

Kickoff, today
Meet the companies and hear their problem statements.

Build, over the week
Work solo or in a team of two or three.

Finals, 17 Oct
Pitch your work to the company teams.

PROBLEM STATEMENTS

01
Water efficiency
BlueNexus · Data Analytics / AI/ML / Engineering

02
Impact reporting
BlueNexus · ESG / Data Analytics

03
Lead generation
Bizsu · Business Development / AI Engineering

04
Brand content
Bizsu · Marketing & Comms

05
Technology fit
beez-fm · Data Visualisation

06
Geospatial data
SystemEarth · Geospatial / Data Engineering

myprojet.co

BlueNexus Technologies

OPENING KEYNOTE

AI-operated water treatment

BlueNexus builds AI systems that run water treatment plants, so they need fewer staff on site, break down less often and cost less to run.

Today's Agenda

Introductions 12:00 PM

Welcome and keynote speakers.

Fireside chat 12:45 PM

A panel with all four partner companies.

Company Q&A 1:45 PM

Each company takes questions on its problem statements.

Focus groups 2:15 PM

Meet the companies by track and find a teammate.

Wrap up 3:00 PM

Rank your tracks in the Google Form.

Fireside Chat

01 · Water technology

BlueNexus

Builds AI systems that operate water treatment plants.

02 · Climate technology

Bizsu

Patented ceramic nets that help air conditioners use less electricity.

03 · Building efficiency

beez-fm

Energy upgrades for buildings with no upfront cost, paid back from measured savings.

04 · Supply chain compliance

SystemEarth

Helps companies check that their suppliers meet sustainability rules.

06 · Organiser

Projet

Runs proof-of-work case competitions with real companies.

BlueNexus Technologies

A water technology company in Singapore. BlueNexus builds AI systems that run water treatment plants, so they need fewer staff on site, break down less often and cost less to run.

bizsu

A climate technology company working in Malaysia and Singapore. Its patented natural ceramic net helps air conditioners cool a room using less electricity.

beez fm

A marketplace in Asia Pacific for cutting energy use in buildings. Owners pay nothing upfront for upgrades, and investors are paid back from the energy savings.

SystemEarth

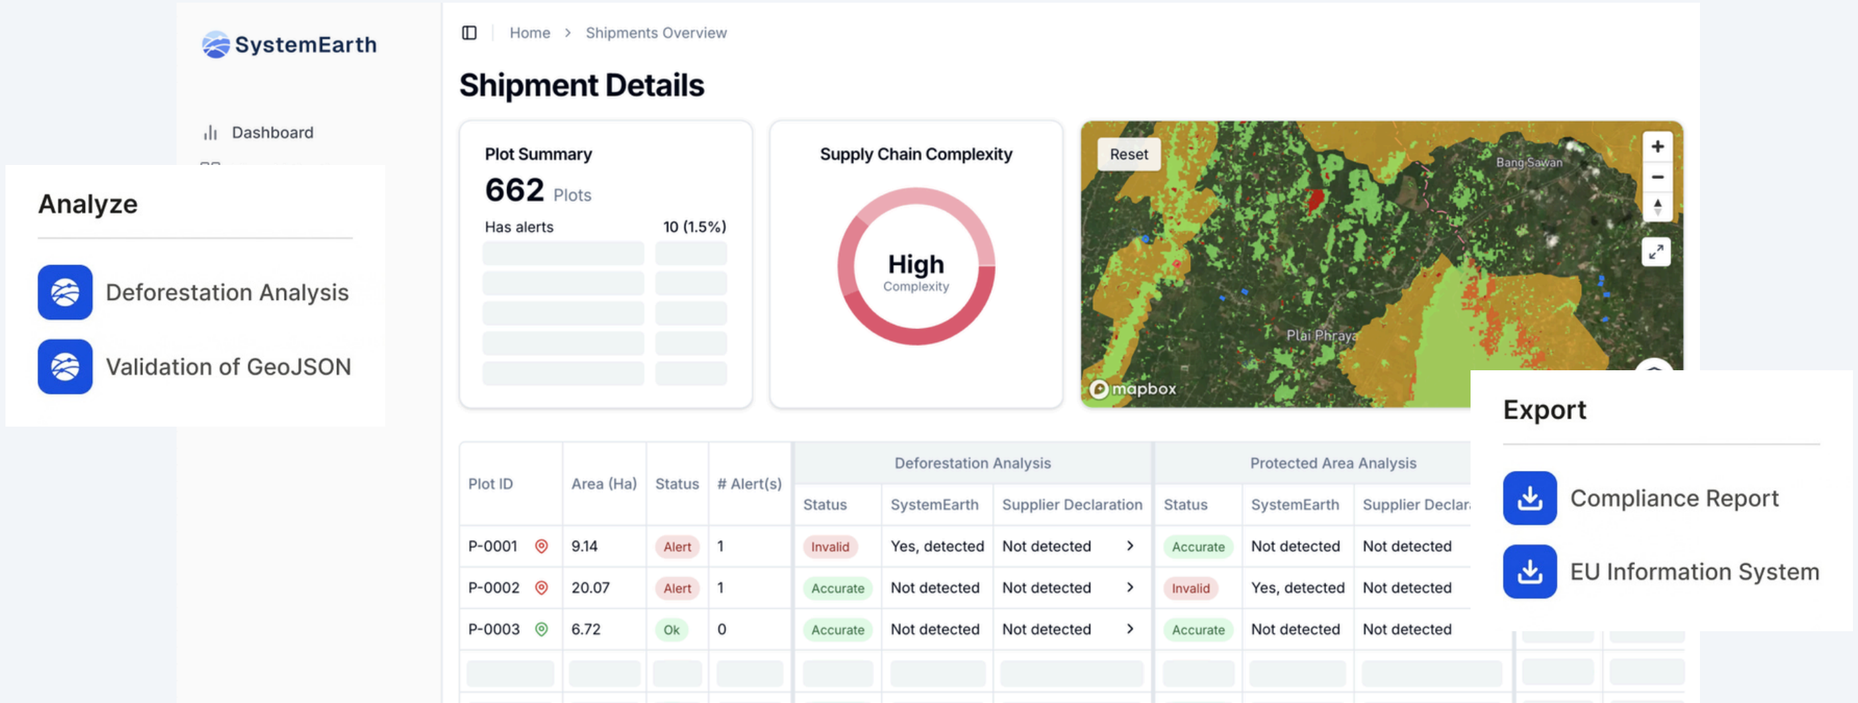

A Singapore-based platform that helps companies check that their suppliers meet sustainability and due diligence rules, especially in natural rubber and timber supply chains.

© 2026 SystemEarth Pte Ltd

SystemEarth

One platform to navigate sustainable procurement

We build software platforms for sustainability teams to leverage space intelligence and big data analytics, to solve their biggest challenges.

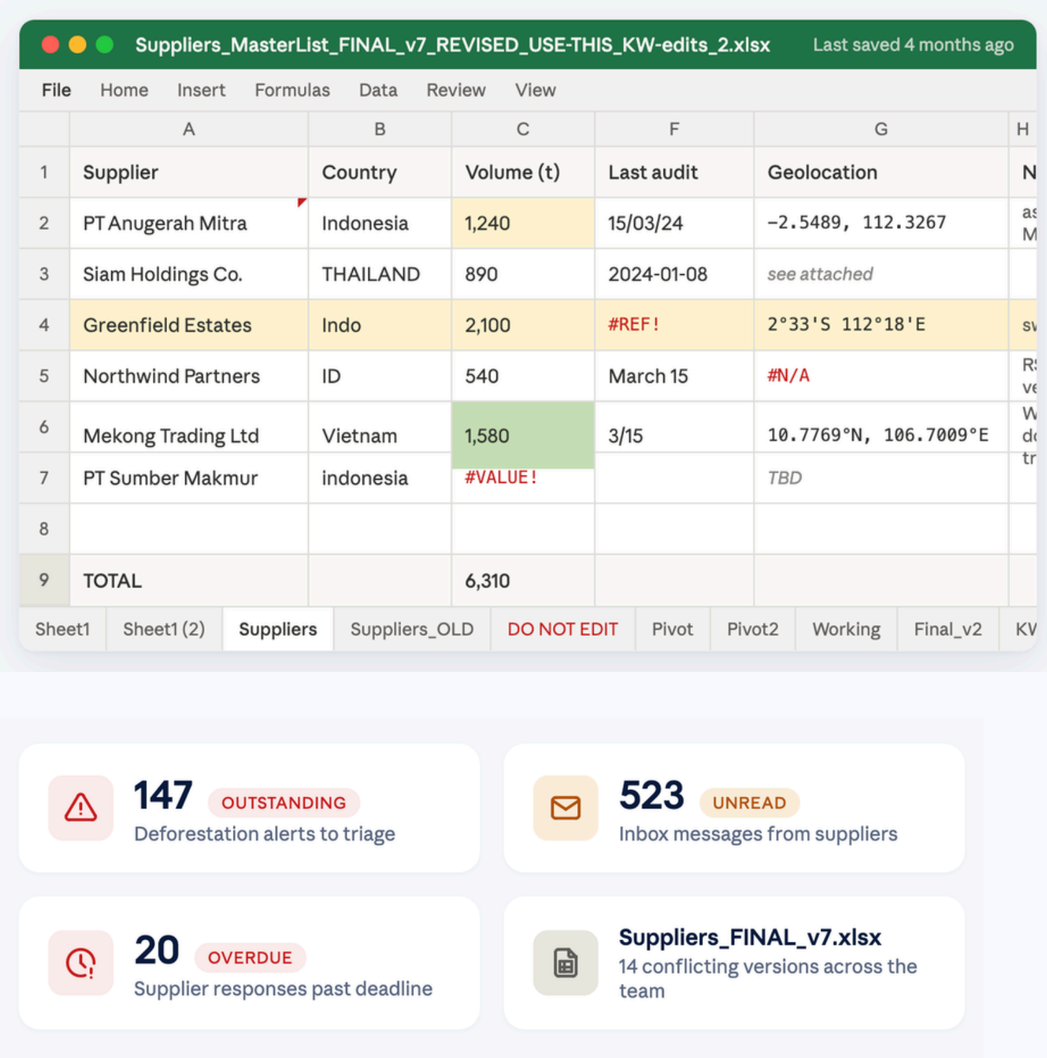

© 2026 SystemEarth Pte Ltd

Problem

Sustainability needs better software

Sustainability professionals were made to make impact, not do busy work.
Excel is a terrible database, and managing hundreds of suppliers by email is a chore.
We need a workspace that cuts through the noise and helps to make real change on the ground.

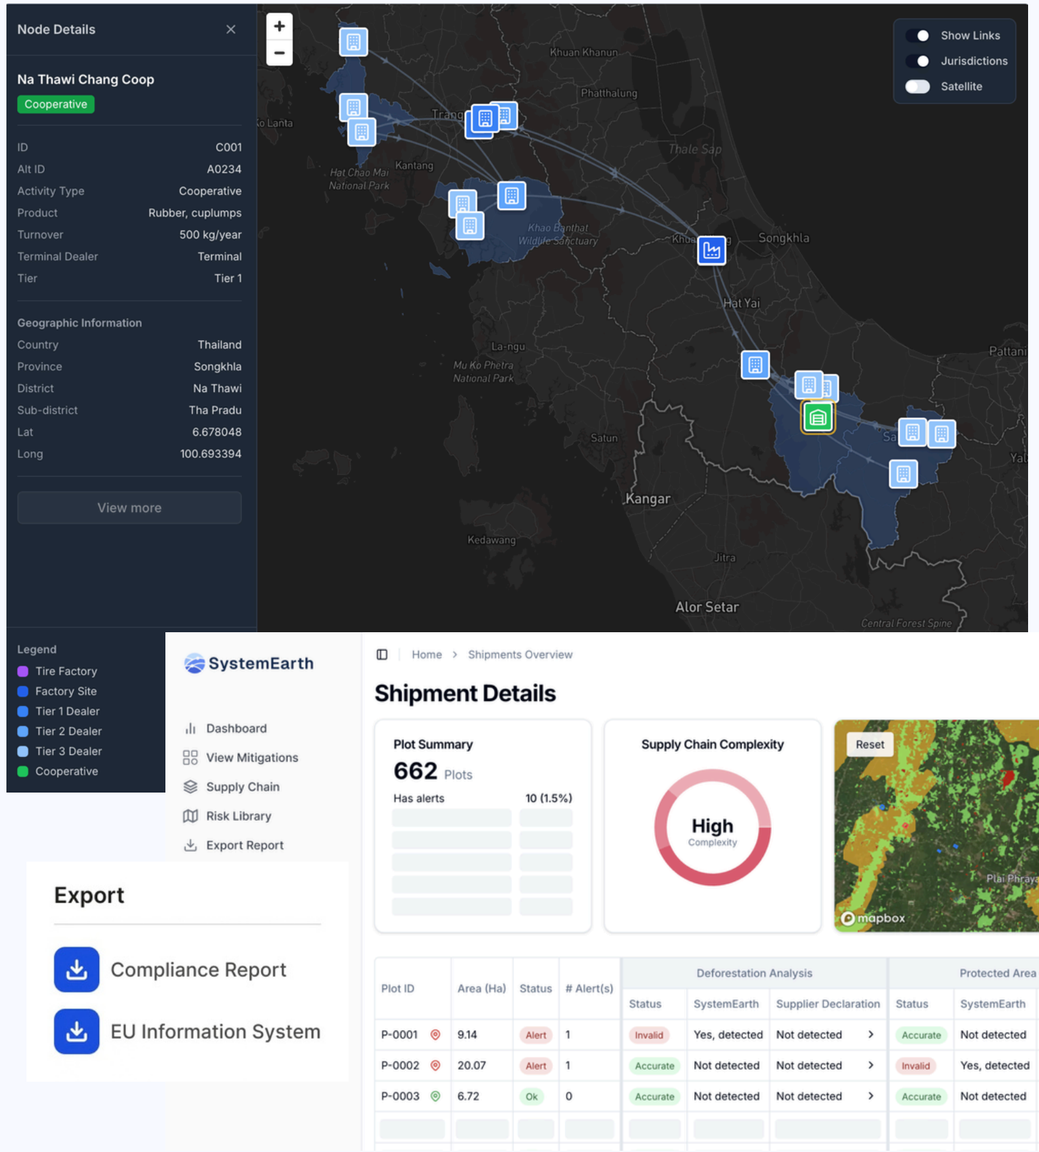

© 2026 SystemEarth Pte Ltd

Solution

And we’re building it at SystemEarth

SystemEarth is built by practitioners, for practitioners.
We consolidate great tooling in one place, allowing you to aggregate, analyze and address risk across your entire supply chain.

Fireside Chat

01 · Water technology

BlueNexus

Builds AI systems that operate water treatment plants.

02 · Climate technology

Bizsu

Patented ceramic nets that help air conditioners use less electricity.

03 · Building efficiency

beez-fm

Energy upgrades for buildings with no upfront cost, paid back from measured savings.

Runs proof-of-work case competitions with real companies.

Problem statements

BlueNexus: two ways to work with us

DATA ANALYTICS / AI/ML / ENGINEERING

Improving Water Treatment Efficiency Through Operational Data Analytics

How can BlueNexus use operational data to identify inefficient or abnormal plant operation and provide early insights that help reduce energy, chemical and water consumption while maintaining treatment performance?

ESG / DATA ANALYTICS

Measuring and Communicating the Sustainability Impact of Autonomous Water Systems

How can BlueNexus measure and present the sustainability impact of its autonomous water systems in a way that is credible and useful for clients' ESG reporting?

Problem statements

Bizsu: two ways to work with us

BUSINESS DEVELOPMENT / AI ENGINEERING

Build a Scalable Lead-Generation and Sales Engine

How might we develop a scalable strategy to generate qualified leads and drive sales among homeowners?

MARKETING & COMMS

Build Brand Awareness Through High-Impact Content

How might we increase brand awareness and motivate potential customers to take action through engaging content?

Problem statement

beez-fm: make the recommendation obvious

DATA VISUALISATION

Visualising Technology Fit to Help Building Owners Choose the Right Efficiency Solution

beez-fm's RizaOne platform matches each connected building to the right efficiency technology using that building's own energy data. Before an owner agrees to a zero-CAPEX pilot, they need to see why a specific technology was recommended for their building, and trust it.

How can beez-fm visualise a building's energy profile and technology match so that owners can clearly see and trust why a specific recommendation fits their building?

Problem statement

SystemEarth: keep the decision, not the data

GEOSPATIAL / DATA ENGINEERING

Building Multi-Layer, Multi-Year Geospatial Data

A compliance decision rarely needs the entire raw layer. It needs specific segments of pixel information: forest presence at the regulatory cut-off date, degradation over time, overlapping geometry and ESG risks, delivered fast and accurately.

Present on a specific use case and demonstrate how SystemEarth can represent multiple geospatial layers across time and space in a compact and query-efficient form, while preserving the information required to reproduce plot-level compliance decisions.

© 2026 SystemEarth Pte Ltd

© 2026 SystemEarth Pte Ltd

What goes into a plot-level compliance decision?

For every farm plot, SystemEarth overlays multiple geospatial layers to answer EUDR questions: was the land forested at the cut-off date, has it been deforested since, and is it legal to produce there?

- **Natural forest baseline**

  Forest presence at the EUDR cut-off date of 31 December 2020

- **Tree cover loss and deforestation alerts**

  Annual loss and near-real-time alerts to track deforestation and degradation over time

- **Protected and restricted-use areas**

  Land legality layers from national and international datasets

- **Plot geometries, monitored over time**

  Plot polygons checked against every layer, and re-checked as layers update year after year

© 2026 SystemEarth Pte Ltd

Too much raw data, only a few pixels that matter

A compliance decision rarely needs the entire raw layer. It needs specific segments of pixel information, delivered fast and accurately.

- ### A composite of many layers

  Tree cover loss, natural forest baselines, restricted-use areas and more, stacked across years

- ### Decisions need only segments

  Forest at the cut-off date, degradation over time, overlapping geometry, ESG risks

- ### Performance without losing accuracy

  Vast volumes of data must be handled efficiently without changing any outcome

- ### Your challenge

  Pick a use case and show how multiple layers across time and space can be stored in a compact, query-efficient form that still reproduces plot-level compliance decisions

© 2026 SystemEarth Pte Ltd

What we would like to see

1 Layer analysis

Which layers and attributes are essential, and which can be simplified, summarised or dropped. Ground it in regulatory definitions for your use case, e.g. forest thresholds and cut-off dates.

2 Encoding strategy and working prototype

Combine multiple layers and time steps into a single dataset or architecture. Encode a sample set of layers for one region and query the compressed data.

3 Evaluation

Compare your approach against the original layers on storage, query performance and fidelity of plot-level results (next slide).

© 2026 SystemEarth Pte Ltd

How solutions will be evaluated

Storage efficiency	Query performance	Result fidelity
Reduction in storage requirements versus the original layers. Bonus: estimate infrastructure and processing costs to store, update and query.	Query speed (effort, processing time) and resource requirements (e.g. additional storage) for representative plot-level queries	Decision fidelity: % of plots where all compliance outputs match the original layers. Pixel fidelity: how well pixel-level detail is preserved, where relevant
How much smaller?	**How much faster?**	**Same decisions?**

What happens next.

Kickoff today. Finals on 17 Oct.

01 · Today

Pick your tracks

Speak to the company representatives. Rank your tracks in the Google Form. Tracks are confirmed by the end of today.

02 · Solo or in pairs

Find a teammate

Work on your own or in a team of two or three. Use the focus groups to meet people.

03 · 10 to 17 Oct

Build

Work on your company's problem statement over the week.

04 · 13 Oct, 6 to 8 PM

Carbon workshop

Run by NUS CAT with Projet. Attendees get priority for testimonials.

05 · 17 Oct

Finals

Pitch your work directly to the company teams.

06 · What you get

Proof of work

A real project for your portfolio.
Outstanding work earns a signed, written testimonial.
Job offers.

Thank you!
